

Prerequisites

- *VIRTUAL BOX*: it is used for installing the operating system on it.
- *OPERATING SYSTEM*: You can install Hadoop on Linux based operating systems. Ubuntu and CentOS are very commonly used. In this tutorial, we are using CentOS.
- *JAVA*: You need to install the Java 8 package on your system.
- *HADOOP*: You require Hadoop 2.7.3 package.

Install Hadoop

Step 1: [Click here](#) to download the Java 8 Package. Save this file in your home directory.

Step 2: Extract the Java Tar File.

Command: `tar -xvf jdk-8u101-linux-i586.tar.gz`

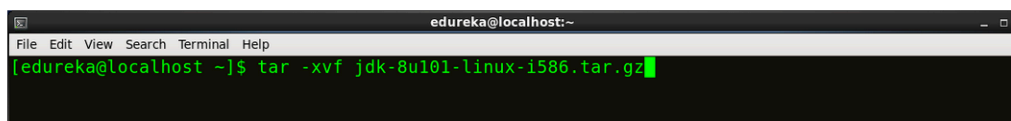

A terminal window with a dark background and light green text. The title bar reads 'edureka@localhost:~'. The menu bar includes 'File', 'Edit', 'View', 'Search', 'Terminal', and 'Help'. The command prompt shows '[edureka@localhost ~]\$ tar -xvf jdk-8u101-linux-i586.tar.gz' followed by a green cursor.

Fig: Hadoop Installation – Extracting Java Files

Step 3: Download the Hadoop 2.7.3 Package.

Command: `wget https://archive.apache.org/dist/hadoop/core/hadoop-2.7.3/hadoop-2.7.3.tar.gz`

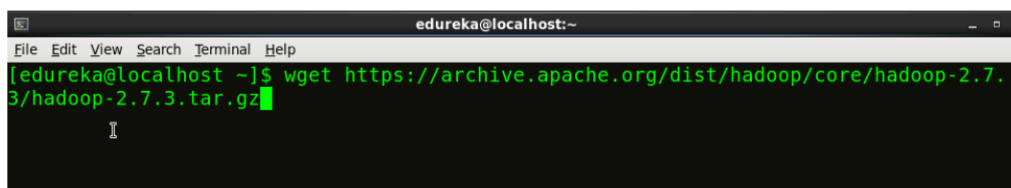

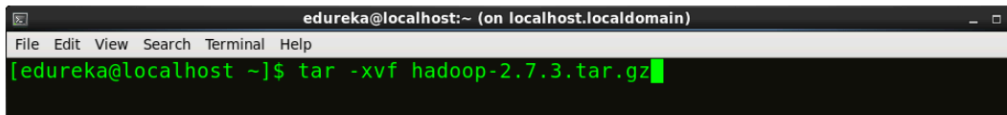

A terminal window with a dark background and light green text. The title bar reads 'edureka@localhost:~'. The menu bar includes 'File', 'Edit', 'View', 'Search', 'Terminal', and 'Help'. The command prompt shows '[edureka@localhost ~]\$ wget https://archive.apache.org/dist/hadoop/core/hadoop-2.7.3/hadoop-2.7.3.tar.gz' followed by a green cursor.

Fig: Hadoop Installation – Downloading Hadoop

Step 4: Extract the Hadoop tar File.

Command: `tar -xvf hadoop-2.7.3.tar.gz`

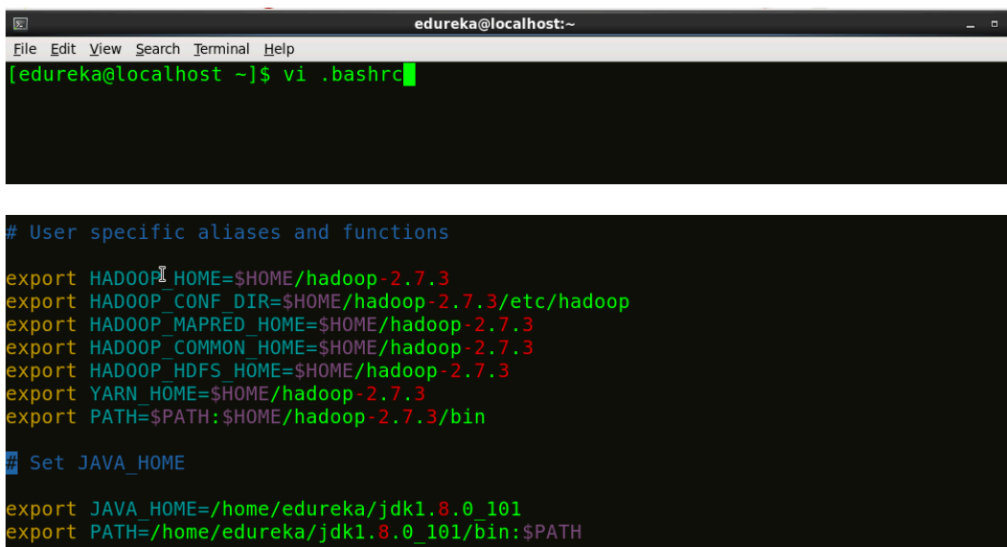

```
edureka@localhost:~ (on localhost.localdomain)
File Edit View Search Terminal Help
[edureka@localhost ~]$ tar -xvf hadoop-2.7.3.tar.gz
```

Fig: Hadoop Installation – Extracting Hadoop Files

Step 5: Add the Hadoop and Java paths in the bash file (.bashrc).

Open. **bashrc** file. Now, add Hadoop and Java Path as shown below.

Command: `vi .bashrc`

```
edureka@localhost:~
File Edit View Search Terminal Help
[edureka@localhost ~]$ vi .bashrc
```

```
# User specific aliases and functions

export HADOOP_HOME=$HOME/hadoop-2.7.3
export HADOOP_CONF_DIR=$HOME/hadoop-2.7.3/etc/hadoop
export HADOOP_MAPRED_HOME=$HOME/hadoop-2.7.3
export HADOOP_COMMON_HOME=$HOME/hadoop-2.7.3
export HADOOP_HDFS_HOME=$HOME/hadoop-2.7.3
export YARN_HOME=$HOME/hadoop-2.7.3
export PATH=$PATH:$HOME/hadoop-2.7.3/bin

# Set JAVA_HOME
export JAVA_HOME=/home/edureka/jdk1.8.0_101
export PATH=/home/edureka/jdk1.8.0_101/bin:$PATH
```

Fig: Hadoop Installation – Setting Environment Variable

Then, save the bash file and close it.

For applying all these changes to the current Terminal, execute the source command.

Command: source .bashrc

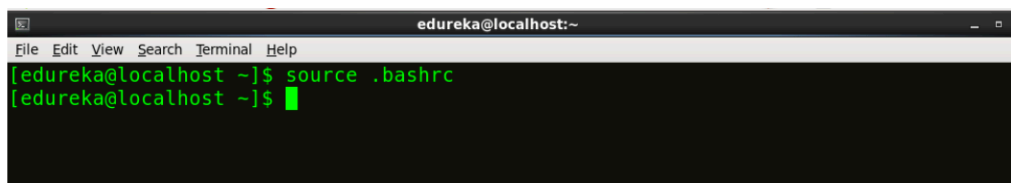

A terminal window titled 'edureka@localhost:~' with a menu bar (File, Edit, View, Search, Terminal, Help). The prompt is '[edureka@localhost ~]\$'. The command 'source .bashrc' has been entered and executed, resulting in a new prompt '[edureka@localhost ~]\$'.

Fig: Hadoop Installation – Refreshing environment variables

To make sure that Java and Hadoop have been properly installed on your system and can be accessed through the Terminal, execute the java -version and hadoop version commands.

Command: java -version

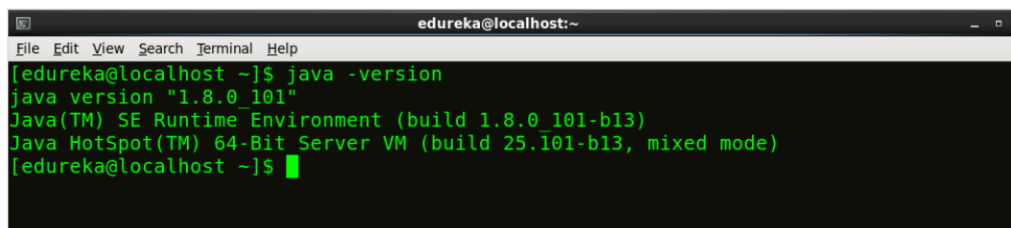

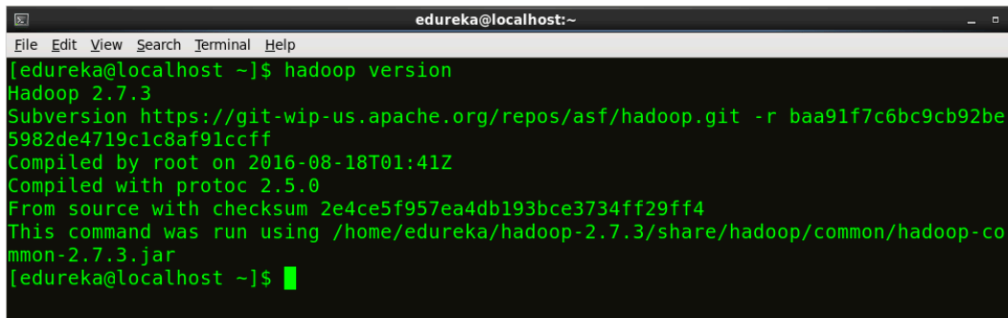

A terminal window titled 'edureka@localhost:~' with a menu bar (File, Edit, View, Search, Terminal, Help). The prompt is '[edureka@localhost ~]\$'. The command 'java -version' has been entered and executed, resulting in the following output: 'java version "1.8.0_101"', 'Java(TM) SE Runtime Environment (build 1.8.0_101-b13)', and 'Java HotSpot(TM) 64-Bit Server VM (build 25.101-b13, mixed mode)'. The prompt is now '[edureka@localhost ~]\$'.

Fig: Hadoop Installation – Checking Java Version

Command: hadoop version

A terminal window titled 'edureka@localhost:~' with a menu bar (File, Edit, View, Search, Terminal, Help). The terminal shows the command 'hadoop version' being executed. The output is as follows:

```
[edureka@localhost ~]$ hadoop version
Hadoop 2.7.3
Subversion https://git-wip-us.apache.org/repos/asf/hadoop.git -r baa91f7c6bc9cb92be5982de4719c1c8af91ccff
Compiled by root on 2016-08-18T01:41Z
Compiled with protoc 2.5.0
From source with checksum 2e4ce5f957ea4db193bce3734ff29ff4
This command was run using /home/edureka/hadoop-2.7.3/share/hadoop/common/hadoop-common-2.7.3.jar
[edureka@localhost ~]$
```

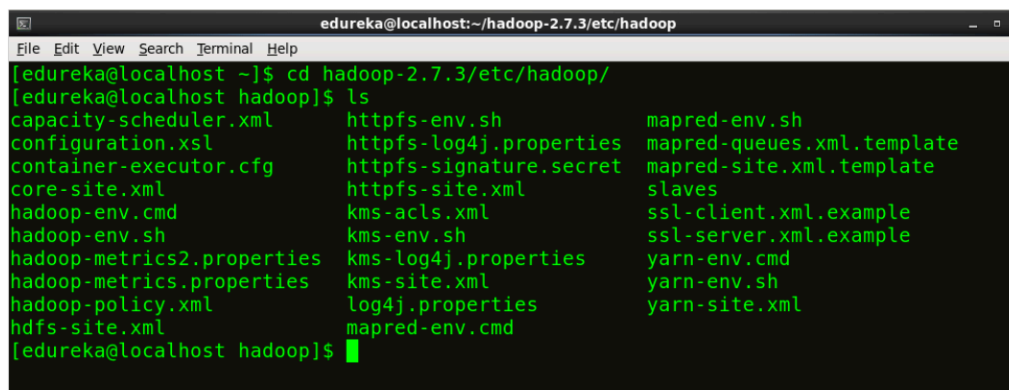

Fig: Hadoop Installation – Checking Hadoop Version

Step 6: Edit the **Hadoop Configuration files**.

Command: `cd hadoop-2.7.3/etc/hadoop/`

Command: ls

All the Hadoop configuration files are located in **hadoop-2.7.3/etc/hadoop** directory as you can see in the snapshot below:

A terminal window titled 'edureka@localhost:~/hadoop-2.7.3/etc/hadoop' showing the output of the 'ls' command. The files are listed in three columns. The first column contains: capacity-scheduler.xml, configuration.xsl, container-executor.cfg, core-site.xml, hadoop-env.cmd, hadoop-env.sh, hadoop-metrics2.properties, hadoop-metrics.properties, hadoop-policy.xml, and hdfs-site.xml. The second column contains: httpfs-env.sh, httpfs-log4j.properties, httpfs-signature.secret, httpfs-site.xml, kms-acls.xml, kms-env.sh, kms-log4j.properties, kms-site.xml, log4j.properties, and mapred-env.cmd. The third column contains: mapred-env.sh, mapred-queues.xml.template, mapred-site.xml.template, slaves, ssl-client.xml.example, ssl-server.xml.example, yarn-env.cmd, yarn-env.sh, and yarn-site.xml. The prompt '[edureka@localhost hadoop]\$' is visible at the bottom.

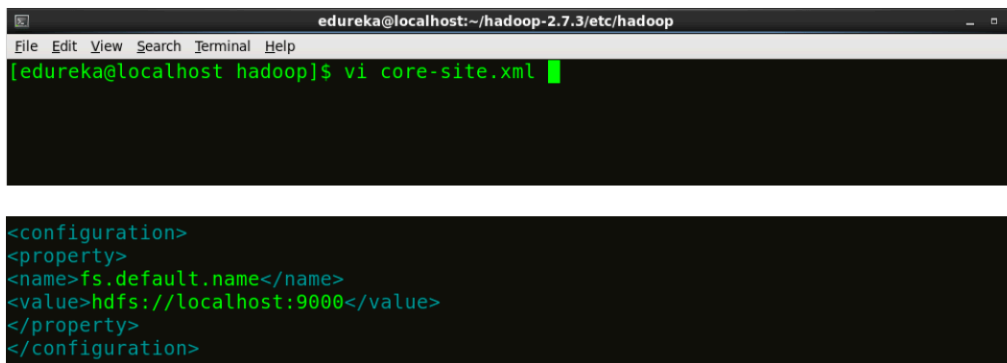

```
edureka@localhost:~/hadoop-2.7.3/etc/hadoop
File Edit View Search Terminal Help
[edureka@localhost ~]$ cd hadoop-2.7.3/etc/hadoop/
[edureka@localhost hadoop]$ ls
capacity-scheduler.xml      httpfs-env.sh              mapred-env.sh
configuration.xsl           httpfs-log4j.properties   mapred-queues.xml.template
container-executor.cfg      httpfs-signature.secret   mapred-site.xml.template
core-site.xml               httpfs-site.xml           slaves
hadoop-env.cmd              kms-acls.xml               ssl-client.xml.example
hadoop-env.sh               kms-env.sh                 ssl-server.xml.example
hadoop-metrics2.properties kms-log4j.properties      yarn-env.cmd
hadoop-metrics.properties kms-site.xml               yarn-env.sh
hadoop-policy.xml           log4j.properties          yarn-site.xml
hdfs-site.xml               mapred-env.cmd
```

Fig: Hadoop Installation – Hadoop Configuration Files

Step 7: Open *core-site.xml* and edit the property mentioned below inside configuration tag:

core-site.xml informs Hadoop daemon where NameNode runs in the cluster. It contains configuration settings of Hadoop core such as I/O settings that are common to HDFS & MapReduce.

Command: vi core-site.xml

```
edureka@localhost:~/hadoop-2.7.3/etc/hadoop
File Edit View Search Terminal Help
[edureka@localhost hadoop]$ vi core-site.xml

<configuration>
<property>
<name>fs.default.name</name>
<value>hdfs://localhost:9000</value>
</property>
</configuration>
```

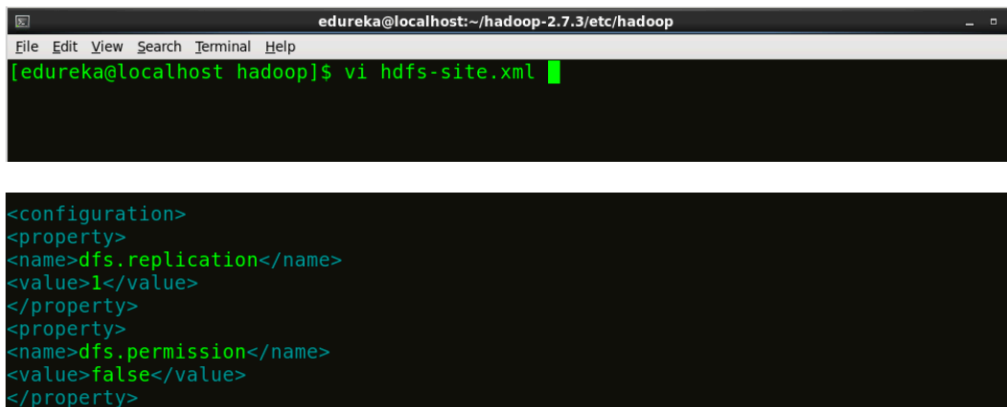

Fig: Hadoop Installation – Configuring core-site.xml

```
1 <?xml version="1.0" encoding="UTF-8"?>
2 <?xml-stylesheet type="text/xsl" href="configuration.xsl"?>
3 <configuration>
4 <property>
5 <name>fs.default.name</name>
6 <value>hdfs://localhost:9000</value>
7 </property>
8 </configuration>
```

Step 8: Edit *hdfs-site.xml* and edit the property mentioned below inside configuration tag:

hdfs-site.xml contains configuration settings of HDFS daemons (i.e. NameNode, DataNode, Secondary NameNode). It also includes the replication factor and block size of HDFS.

Command: vi hdfs-site.xml

```
edureka@localhost:~/hadoop-2.7.3/etc/hadoop
File Edit View Search Terminal Help
[edureka@localhost hadoop]$ vi hdfs-site.xml

<configuration>
<property>
<name>dfs.replication</name>
<value>1</value>
</property>
<property>
<name>dfs.permission</name>
<value>false</value>
</property>
```

Fig: Hadoop Installation – Configuring hdfs-site.xml

```
1  <?xml version="1.0" encoding="UTF-8"?>
2  <?xml-stylesheet type="text/xsl" href="configuration.xsl"?>
3  <configuration>
4  <property>
5  <name>dfs.replication</name>
6  <value>1</value>
7  </property>
8  <property>
9  <name>dfs.permission</name>
10 <value>>false</value>
11 </property>
12 </configuration>
```

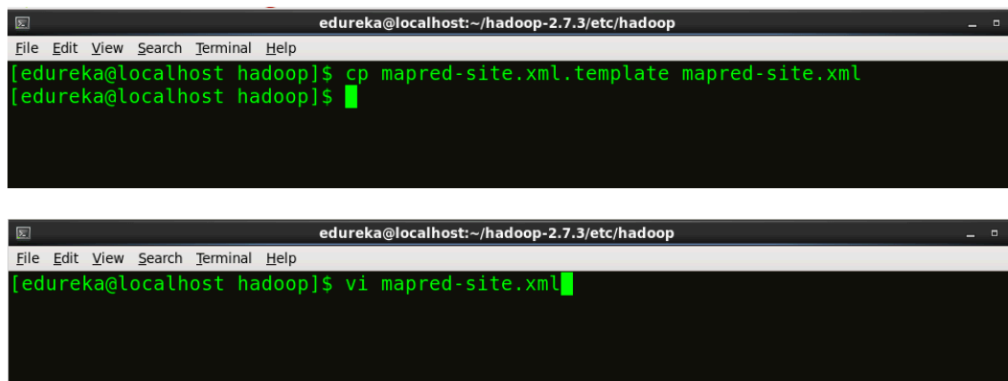

Step 9: Edit the *mapred-site.xml* file and edit the property mentioned below inside configuration tag:

mapred-site.xml contains configuration settings of MapReduce application like number of JVM that can run in parallel, the size of the mapper and the reducer process, CPU cores available for a process, etc.

In some cases, *mapred-site.xml* file is not available. So, we have to create the *mapred-site.xml* file using *mapred-site.xml* template.

Command: `cp mapred-site.xml.template mapred-site.xml`

Command: `vi mapred-site.xml`.

```
edureka@localhost:~/hadoop-2.7.3/etc/hadoop
File Edit View Search Terminal Help
[edureka@localhost hadoop]$ cp mapred-site.xml.template mapred-site.xml
[edureka@localhost hadoop]$

edureka@localhost:~/hadoop-2.7.3/etc/hadoop
File Edit View Search Terminal Help
[edureka@localhost hadoop]$ vi mapred-site.xml
```

```
<configuration>
<property>
<name>mapreduce.framework.name</name>
<value>yarn</value>
</property>
</configuration>
```

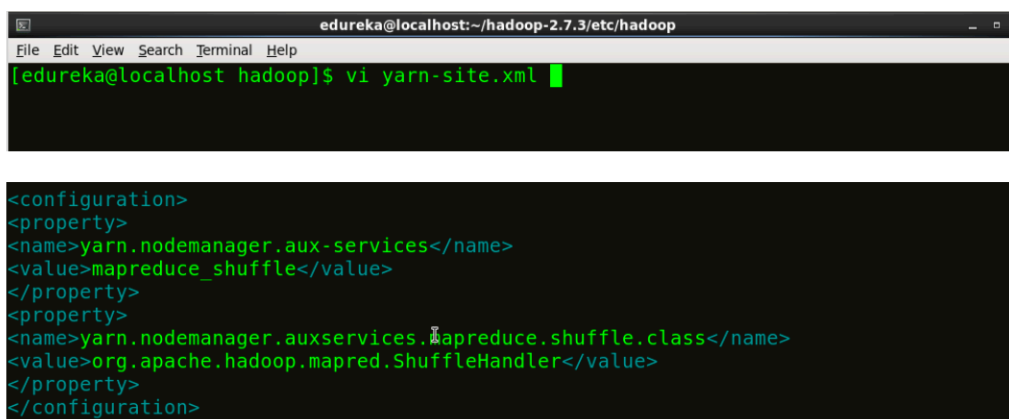

Fig: Hadoop Installation – Configuring mapred-site.xml

```
1 <?xml version="1.0" encoding="UTF-8"?>
2 <?xml-stylesheet type="text/xsl" href="configuration.xsl"?>
3 <configuration>
4 <property>
5 <name>mapreduce.framework.name</name>
6 <value>yarn</value>
7 </property>
8 </configuration>
```

Step 10: Edit *yarn-site.xml* and edit the property mentioned below inside configuration tag:

yarn-site.xml contains configuration settings of ResourceManager and NodeManager like application memory management size, the operation needed on program & algorithm, etc.

Command: vi yarn-site.xml

```
edureka@localhost:~/hadoop-2.7.3/etc/hadoop
File Edit View Search Terminal Help
[edureka@localhost hadoop]$ vi yarn-site.xml

<configuration>
<property>
<name>yarn.nodemanager.aux-services</name>
<value>mapreduce_shuffle</value>
</property>
<property>
<name>yarn.nodemanager.auxservices.mapreduce.shuffle.class</name>
<value>org.apache.hadoop.mapred.ShuffleHandler</value>
</property>
</configuration>
```

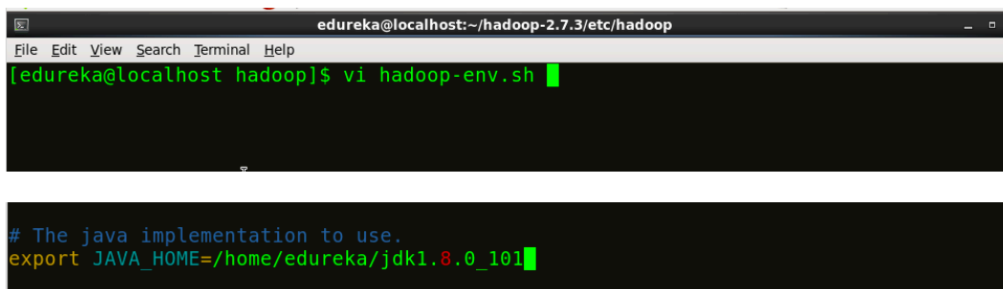

Fig: Hadoop Installation – Configuring yarn-site.xml

```
1  <?xml version="1.0">
2  <configuration>
3  <property>
4  <name>yarn.nodemanager.aux-services</name>
5  <value>mapreduce_shuffle</value>
6  </property>
7  <property>
8  <name>yarn.nodemanager.auxservices.mapreduce.shuffle.class</name>
9  <value>org.apache.hadoop.mapred.ShuffleHandler</value>
10 </property>
11 </configuration>
```

Step 11: Edit *hadoop-env.sh* and add the Java Path as mentioned below:

hadoop-env.sh contains the environment variables that are used in the script to run Hadoop like Java home path, etc.

Command: vi hadoop-env.sh

```
edureka@localhost: ~/hadoop-2.7.3/etc/hadoop
File Edit View Search Terminal Help
[edureka@localhost hadoop]$ vi hadoop-env.sh

# The java implementation to use.
export JAVA_HOME=/home/edureka/jdk1.8.0_101
```

Fig: Hadoop Installation – Configuring hadoop-env.sh

Step 12: Go to Hadoop home directory and format the NameNode.

Command: cd

Command: cd hadoop-2.7.3

Command: bin/hadoop namenode -format

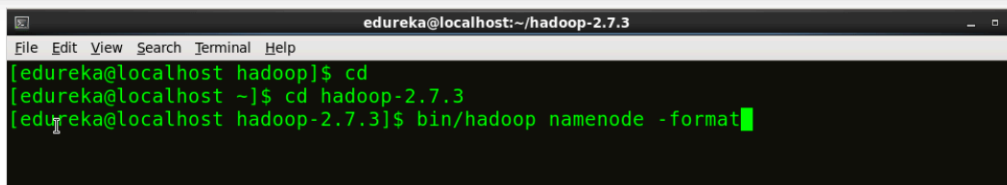

A terminal window titled 'edureka@localhost:~/hadoop-2.7.3' with a menu bar (File, Edit, View, Search, Terminal, Help). The terminal shows three commands: '[edureka@localhost hadoop]\$ cd', '[edureka@localhost ~]\$ cd hadoop-2.7.3', and '[edureka@localhost hadoop-2.7.3]\$ bin/hadoop namenode -format' with a green cursor at the end.

Fig: Hadoop Installation – Formatting NameNode

This formats the HDFS via NameNode. This command is only executed for the first time. Formatting the file system means initializing the directory specified by the `dfs.name.dir` variable.

Never format, up and running Hadoop filesystem. You will lose all your data stored in the HDFS.

Step 13: Once the NameNode is formatted, go to `hadoop-2.7.3/sbin` directory and start all the daemons.

Command: `cd hadoop-2.7.3/sbin`

Either you can start all daemons with a single command or do it individually.

Command: `./start-all.sh`

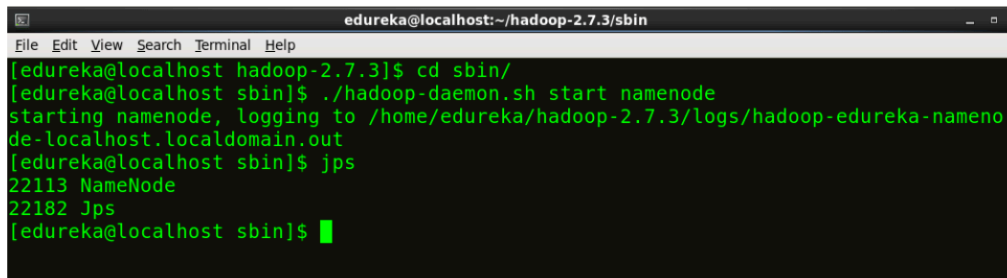

The above command is a combination of ***start-dfs.sh***, ***start-yarn.sh*** & ***mr-jobhistory-daemon.sh***

Or you can run all the services individually as below:

Start NameNode:

The NameNode is the centerpiece of an HDFS file system. It keeps the directory tree of all files stored in the HDFS and tracks all the file stored across the cluster.

Command: `./hadoop-daemon.sh start namenode`

A terminal window titled 'edureka@localhost:~/hadoop-2.7.3/sbin' with a menu bar (File, Edit, View, Search, Terminal, Help). The terminal shows the following commands and output:

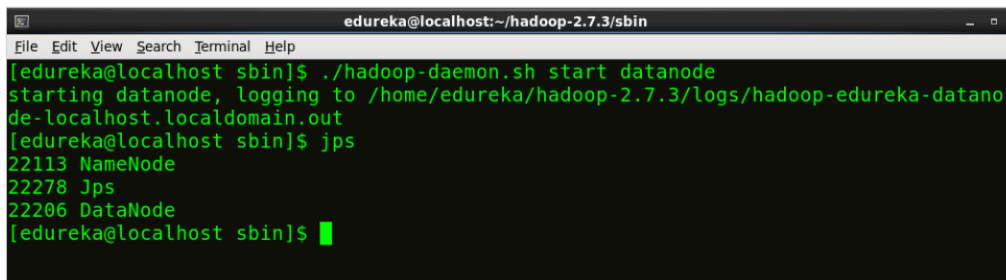

```
[edureka@localhost hadoop-2.7.3]$ cd sbin/
[edureka@localhost sbin]$ ./hadoop-daemon.sh start namenode
starting namenode, logging to /home/edureka/hadoop-2.7.3/logs/hadoop-edureka-nameno
de-localhost.localdomain.out
[edureka@localhost sbin]$ jps
22113 NameNode
22182 Jps
[edureka@localhost sbin]$
```

Fig: Hadoop Installation – Starting NameNode

Start DataNode:

On startup, a DataNode connects to the Namenode and it responds to the requests from the Namenode for different operations.

Command: `./hadoop-daemon.sh start datanode`

A terminal window titled 'edureka@localhost:~/hadoop-2.7.3/sbin' with a menu bar (File, Edit, View, Search, Terminal, Help). The terminal shows the command `./hadoop-daemon.sh start datanode` being executed, followed by the output: 'starting datanode, logging to /home/edureka/hadoop-2.7.3/logs/hadoop-edureka-datanode-localhost.localdomain.out'. Then, the command `jps` is executed, showing the following output: '22113 NameNode', '22278 Jps', and '22206 DataNode'. The prompt returns to `[edureka@localhost sbin]$` with a green cursor.

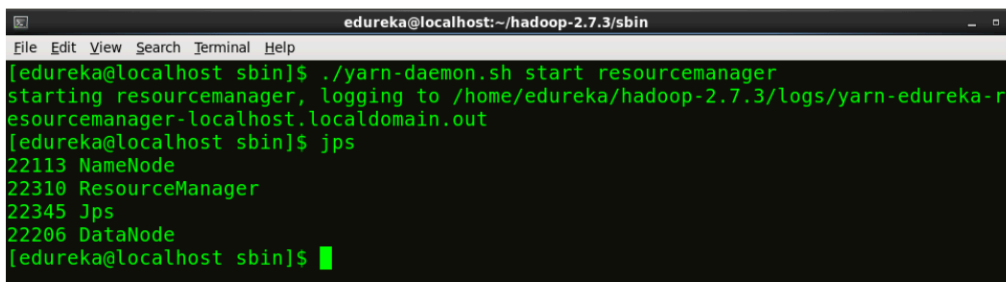

```
edureka@localhost:~/hadoop-2.7.3/sbin
File Edit View Search Terminal Help
[edureka@localhost sbin]$ ./hadoop-daemon.sh start datanode
starting datanode, logging to /home/edureka/hadoop-2.7.3/logs/hadoop-edureka-datanode-localhost.localdomain.out
[edureka@localhost sbin]$ jps
22113 NameNode
22278 Jps
22206 DataNode
[edureka@localhost sbin]$
```

Fig: Hadoop Installation – Starting DataNode

Start ResourceManager:

ResourceManager is the master that arbitrates all the available cluster resources and thus helps in managing the distributed applications running on the YARN system. Its work is to manage each NodeManagers and the each application's ApplicationMaster.

Command: `./yarn-daemon.sh start resourcemanager`

A terminal window titled 'edureka@localhost:~/hadoop-2.7.3/sbin' with a menu bar (File, Edit, View, Search, Terminal, Help). The terminal shows the command `./yarn-daemon.sh start resourcemanager` being executed, followed by the output: 'starting resourcemanager, logging to /home/edureka/hadoop-2.7.3/logs/yarn-edureka-resourcemanager-localhost.localdomain.out'. Then, the command `jps` is executed, showing the following output: '22113 NameNode', '22310 ResourceManager', '22345 Jps', and '22206 DataNode'. The prompt returns to `[edureka@localhost sbin]$` with a green cursor.

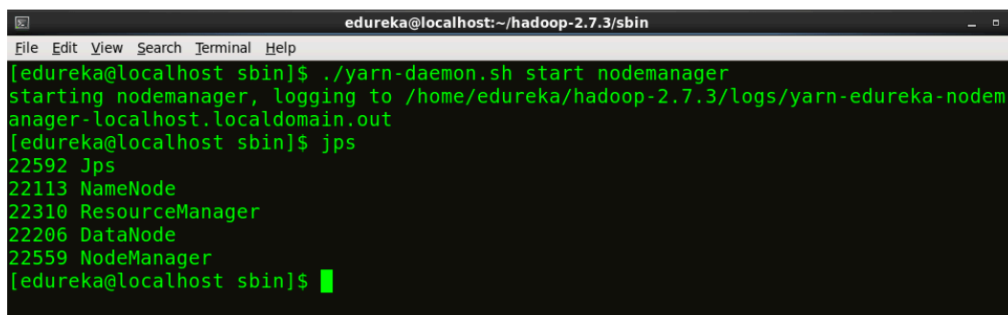

```
edureka@localhost:~/hadoop-2.7.3/sbin
File Edit View Search Terminal Help
[edureka@localhost sbin]$ ./yarn-daemon.sh start resourcemanager
starting resourcemanager, logging to /home/edureka/hadoop-2.7.3/logs/yarn-edureka-resourcemanager-localhost.localdomain.out
[edureka@localhost sbin]$ jps
22113 NameNode
22310 ResourceManager
22345 Jps
22206 DataNode
[edureka@localhost sbin]$
```

Fig: Hadoop Installation – Starting ResourceManager

Start NodeManager:

The NodeManager in each machine framework is the agent which is responsible for managing containers, monitoring their resource usage and reporting the same to the ResourceManager.

Command: `./yarn-daemon.sh start nodemanager`

```
edureka@localhost:~/hadoop-2.7.3/sbin
File Edit View Search Terminal Help
[edureka@localhost sbin]$ ./yarn-daemon.sh start nodemanager
starting nodemanager, logging to /home/edureka/hadoop-2.7.3/logs/yarn-edureka-nodemanager-localhost.localdomain.out
[edureka@localhost sbin]$ jps
22592 Jps
22113 NameNode
22310 ResourceManager
22206 DataNode
22559 NodeManager
[edureka@localhost sbin]$
```

Fig: Hadoop Installation – Starting NodeManager

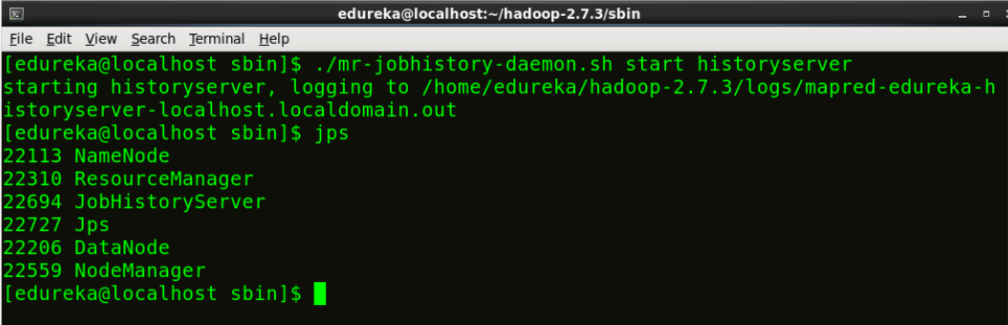

Start JobHistoryServer:

JobHistoryServer is responsible for servicing all job history related requests from client.

Command: `./mr-jobhistory-daemon.sh start historyserver`

Step 14: To check that all the Hadoop services are up and running, run the below command.

Command: `jps`

A terminal window titled 'edureka@localhost:~/hadoop-2.7.3/sbin' shows the execution of the 'jps' command. The output lists several Hadoop daemons with their respective PIDs: NameNode (22113), ResourceManager (22310), JobHistoryServer (22694), Jps (22727), DataNode (22206), and NodeManager (22559). The terminal also shows the command to start the historyserver and its log file location.

```
edureka@localhost:~/hadoop-2.7.3/sbin
File Edit View Search Terminal Help
[edureka@localhost sbin]$ ./mr-jobhistory-daemon.sh start historyserver
starting historyserver, logging to /home/edureka/hadoop-2.7.3/logs/mapred-edureka-h
istoryserver-localhost.localdomain.out
[edureka@localhost sbin]$ jps
22113 NameNode
22310 ResourceManager
22694 JobHistoryServer
22727 Jps
22206 DataNode
22559 NodeManager
[edureka@localhost sbin]$
```

Fig: Hadoop Installation – Checking Daemons

Step 15: Now open the Mozilla browser and go to **localhost:50070/dfshealth.html** to check the NameNode interface.

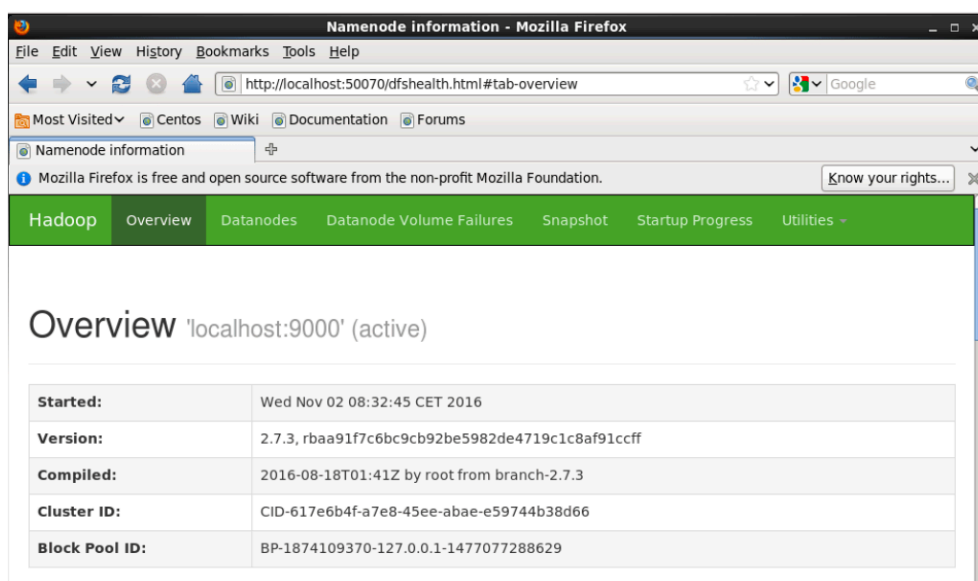

Fig: Hadoop Installation – Starting WebUI

Congratulations, you have successfully installed a single node Hadoop cluster in one go. In our next blog of [Hadoop Tutorial Series](#), we will be covering how to install Hadoop on a multi node cluster as well.
